

CASAHL ecKnowledge

CASAHL ecKnowledge is an enterprise-scale solution for enterprise modernization, supporting transformation, integration, and coexistence among enterprise applications. As the flagship component in CASAHL’s [DART product suite](#) for optimization and modernization, ecKnowledge takes plans developed in CASAHL’s DART Dashboard and puts them into action, embodying nearly twenty years of experience with real-world deployments of collaboration and content-oriented systems from IBM, Microsoft, ECM, and ERP vendors.

Few enterprises rely on a single content system. With this fact in mind, CASAHL designed ecKnowledge to work with a wide range of content systems. The complement of IBM products supported by ecKnowledge, for example, includes Notes/Domino, QuickPlace, Domino Document Manager, and Quickr-Domino. For Microsoft-focused organizations, ecKnowledge works with SharePoint and Office 365, Exchange public folders, Microsoft SQL Server, Azure, and file systems. Supported ECM systems include popular tools such as Documentum, Open Text, Alfresco, and other CMIS-compliant systems.

ecKnowledge addresses common enterprise migration and integration requirements including:

- **Full Integration with CAS AHL DART Lifecycle Manager** – Equipped with rationalization data and survey feedback collected from DART Dashboard users, IT personnel can implement migration, coexistence, and integration tasks in the DART Lifecycle Manager that rely on feedback from CAS AHL ecKnowledge.
- **Coexistence Support** – Many enterprises migrate high-priority applications first and other applications on an as-needed basis, but this scenario often creates an interim need for cross-platform integration as some users continue to work with the original application platform while other users work in the new platform (SharePoint, for instance). Whether this need for collaborative application integration is short-term or on-going, ecKnowledge will detect modified documents and migrate them on a scheduled basis to ensure that both groups of users see the same information.
- **SharePoint-SharePoint Replication** – ecKnowledge supports two-way replication between any application and content source and SharePoint, including other SharePoint sites. Individual structures within SharePoint sites can be replicated between SharePoint sites, with customizable conflict detection and resolution.
- **Hybrid Office 365 Support** – Office 365 deployments are typically hybrid in nature, with some enterprise content stored in the Office 365 cloud and other content stored in on-premises SharePoint servers. ecKnowledge supports one-way or two-way integration in such hybrid deployments. Furthermore, ecKnowledge can off-board content from Office 365, applying filters for content size or usage patterns in order to conform with enterprise compliance standards.
- **Integration with ERP Systems** - Enterprises generally need to integrate SharePoint and/or Office 365 with other enterprise IT assets (ERP or CRM) that store their data in a traditional database (for instance, Microsoft SQL Server, Oracle Database, MySQL, IBM DB2 or ODBC-based). ecKnowledge utilizes a standards-based connector architecture that enables organizations to seamlessly integrate collaborative applications and content with other enterprise systems and resources without devoting large amounts of IT resources to programming.
- **Scalable Server-based Architecture** - The compelling financial and operational advantages of moving to cloud-based solutions such as SharePoint Online lead many organizations to transition some or all of the collaborative applications and content to the cloud and other content to an on-premises deployment. ecKnowledge presents the same tools and features for all deployment scenarios, enabling organizations to take advantage of public and private cloud opportunities as appropriate while also fully leveraging on-premises investments. The ecKnowledge architecture, which supports load-balancing, fail-over, and other enterprise requirements, is the only tool that provides this level of flexibility with a single, consistent interface. In addition, ecKnowledge ships with more than 50 pre-designed migration templates to quick-start any project.
- **Form Generation** – ecKnowledge generates InfoPath and ASP.NET forms from collaborative applications such as Lotus Notes and Exchange public folders. The forms generated strongly resemble the original forms in terms of layout and look and feel, and include the original data types and content (such as keeping the same values in pick lists).

In today's dynamic and resource-constrained business environment, enterprises must optimize their collaborative application and content portfolios in order to remain competitively and financially vibrant. Only ecKnowledge, as part of CAS AHL's unique and comprehensive solution, addresses the full range of modernization requirements. Whether the challenge is in modernizing and migrating legacy applications

from Notes/Domino to the SharePoint platform or consolidating information resources currently spread across products ranging from Documentum to Google Drive/Sites, ecknowledge offers a proven, cost-effective, efficient, scalable, and secure solution for organizations of all sizes and in all industries as part of the [CASAHL DART suite](#).

About CASAHL

Since its inception in 1993, CASAHL has maintained an exclusive focus on providing enterprise-class solutions that optimize and modernize collaboration and content environments such as SharePoint, IBM Notes/Domino, Google Docs, Office 365, Enterprise Content Management, DBMS, and ERP systems. CASAHL has worked with more than 2,000 enterprise customers worldwide.

CASAHL won Microsoft Partner of the Year in 2009 and 2010 for Migration solutions. Platform vendors including IBM, Microsoft, and Sybase have OEMed products from CASAHL to optimize and modernize customer deployments for their respective platforms.

CASAHL's unique solution provides automatic discovery and analysis of existing systems, along with automated generation of transition, coexistence, and integration tasks among previously deployed environments and modern alternatives such as SharePoint and Office 365.
